1. McCandless(2008) 的动态规划
2. Wickens(2011) 的动态规划

一般形式

写成递归形式，

$$V(x_t) = \max_{y_t} \; [F(x_t, y_t) + \beta V(x_{t+1})]$$
$$s.t. \;\; x_{t+1} = G(x_t, y_t)$$

- x_t 是状态变量， y_t 是控制变量。

用目标函数对 y_t 求导，得到一阶条件，

$$F_{y_t}(x_t, y_t) + \beta V_{x_{t+1}}(x_{t+1}) \cdot G_{y_t} = 0 \tag{1}$$

- 关键是 $V_{x_{t+1}}(x_{t+1})$ 未知。
- 根据包络定理，

$$V_{x_t}(x_t) = F_{x_t}(x_t, y_t) + \beta V_{x_{t+1}}(x_{t+1}) \cdot G_{x_t}(x_t, y_t) \tag{2}$$

  - 又回到了原处，$V_{x_{t+1}}(x_{t+1})$ 还是未知。
  - 但如果 $G_{x_t}(x_t, y_t) = 0$ 就可以消掉 $V_{x_{t+1}}(x_{t+1})$。

重要技巧

要使 $G_{x_t}(x_t, y_t) = 0$ 关键在于通过把相关变量移入目标函数，从而让预算约束不要包含 t 期的状态变量。

公式

消掉后，通过把式(2)脚标前推一期，一阶条件最终可以写成，

$$F_{y_t}(x_t, y_t) + \beta F_{x_{t+1}}(x_{t+1}, y_{t+1}) = 0 \tag{3}$$

一个例子

$$V = \max \sum_{t=0}^{T} \beta^t \ln c_t$$
$$s.t. \;\; s_{t+1} - s_t = \alpha(s_t - c_t)$$

写成递归形式，

$$\begin{aligned}
V(s_0) &= \max \sum_{t=0}^{T} \beta^t \left[\ln \left(s_t - \frac{s_{t+1} - s_t}{\alpha} \right) \right] \\
&= \max \left\{ \ln \left(s_0 - \frac{s_1 - s_0}{\alpha} \right) + \beta \cdot \sum_{t=1}^{T} \beta^{t-1} \left[\ln \left(s_t - \frac{s_{t+1} - s_t}{\alpha} \right) \right] \right\} \\
&= \max \left[\ln \left(s_0 - \frac{s_1 - s_0}{\alpha} \right) + \beta \cdot V(s_1) \right]
\end{aligned}$$

第三个等号是因为，

$$V(s_0) = \ln\left(s_0 - \frac{s_1 - s_0}{\alpha}\right) + \beta \ln\left(s_1 - \frac{s_2 - s_1}{\alpha}\right) + \beta^2 \ln\left(s_2 - \frac{s_3 - s_2}{\alpha}\right) + \cdots$$

$$V(s_1) = \ln\left(s_1 - \frac{s_2 - s_1}{\alpha}\right) + \beta \ln\left(s_2 - \frac{s_3 - s_2}{\alpha}\right) + \cdots$$

上述递归可以更一般的写作，

$$\begin{aligned} V(s_t) &= \max \left[\ln\left(s_t - \frac{s_{t+1} - s_t}{\alpha}\right) + \beta \cdot V(s_{t+1})\right] \\ &= \max \left[\ln c_t + \beta \cdot V(s_{t+1})\right] \end{aligned} \tag{4}$$

控制变量选 s_{t+1}

此时预算约束为，

$$s_{t+1} = x_{t+1} = G(x_t, y_t) = y_t = s_{t+1}$$

- $t+1$ 期的状态变量是 s_{t+1}
- 该状态变量是 t 期的控制变量和状态变量的函数，而 t 期的控制变量又恰好是 k_{t+1}，所以本质上，约束就是，

$$k_{t+1} = k_{t+1}$$

  并不包含 t 期的状态变量。
- 因此 $G(x_t, y_t) = G(s_t, s_{t+1}) = s_{t+1}$，有，

$$G_{s_t}(s_t, s_{t+1}) = 0$$

最优规划重写如下，

$$
\begin{aligned}
V(s_t) = \max \quad & [\ln c_t + \beta \cdot V(s_{t+1})] \\
s.t. \quad & s_{t+1} - s_t = \alpha(s_t - c_t)
\end{aligned}
$$

根据式(3)，上述最优规划，有，

$$
\begin{aligned}
\frac{\partial \ln c_t}{\partial s_{t+1}} + \beta \frac{\partial \ln c_{t+1}}{\partial s_{t+1}} =& 0 \\
\Longrightarrow \frac{1}{c_t} \cdot \left(-\frac{1}{\alpha}\right) + \beta \frac{1}{c_{t+1}} \frac{1+\alpha}{\alpha} =& 0 \quad \text{可从约束条件获得} \\
\Longrightarrow c_{t+1} =& (1+\alpha)\beta c_t
\end{aligned}
$$

控制变量选 c_t

此时，约束条件为，

$$s_{t+1} = G(x_t, y_t) = s_t + \alpha(s_t - c_t)$$

有，

$$G_{x_t} = -\alpha \neq 0$$

- 因此不能选 c_t 做控制变量。

1. McCandless(2008) 的动态规划
2. Wickens(2011) 的动态规划

Wickens(2011) 的动态规划

Wickens(2011) 的思路更绝，重新写下式(4)，

$$F_{y_t}(x_t, y_t) + \beta V_{y_t}(x_{t+1}) = 0$$

因为

$$V(x_{t+1}) = F(x_{t+1}, y_{t+1}) + \beta V(x_{t+2})$$

那么直接把 x_{t+2} 看作给定的，就有，

$$\begin{aligned} \frac{\partial V(x_{t+1})}{\partial y_t} &= \frac{\partial F(x_{t+1}, y_{t+1})}{\partial y_{t+1}} \frac{\partial y_{t+1}}{\partial y_t} \\ &= \frac{\partial F(x_{t+1}, y_{t+1})}{\partial y_{t+1}} \frac{\partial y_{t+1}}{\partial x_{t+1}} \frac{\partial x_{t+1}}{\partial y_t} \end{aligned}$$

- $\frac{\partial y_{t+1}}{\partial x_{t+1}} \frac{\partial x_{t+1}}{\partial y_t}$ 可从约束条件直接得到。

重要公式

因此，Wickens(2011) 的一阶条件公式为，

$$F_{y_t}(x_t, y_t) + \beta \frac{\partial F(x_{t+1}, y_{t+1})}{\partial y_{t+1}} \frac{\partial y_{t+1}}{\partial x_{t+1}} \frac{\partial x_{t+1}}{\partial y_t} = 0$$

重复前面的例子

$$
\begin{aligned}
V(s_t) = \max \quad & [\ln c_t + \beta \cdot V(s_{t+1})] \\
s.t. \quad & s_{t+1} - s_t = \alpha(s_t - c_t)
\end{aligned}
$$

此时，即便把 c_t 看作控制变量也无妨，一阶条件为，

$$
\begin{aligned}
\frac{V(s_t)}{\partial c_t} =& \frac{\partial \ln c_t}{\partial c_t} + \beta \frac{\partial \ln c_{t+1}}{\partial c_{t+1}} \frac{\partial c_{t+1}}{\partial s_{t+1}} \frac{\partial s_{t+1}}{\partial c_t} \\
=& \frac{1}{c_t} + \beta \frac{1}{c_{t+1}} \frac{1+\alpha}{\alpha}(-\alpha) = 0 \\
\Longrightarrow c_{t+1} =& (1+\alpha) c_t \beta
\end{aligned}
$$
